

1. After how much duration of inactivity will scheduled refresh get paused?

Ans:

In Power BI Service, a scheduled refresh can be automatically paused after 2 months of inactivity. This generally applies when there has been no activity involving the related semantic model, such as users not accessing the reports or dashboards that depend on it.

When the refresh is paused, the data will no longer be automatically refreshed according to the previous schedule. If the report or semantic model becomes active again, the refresh schedule may need to be resumed or configured again depending on the situation.

This feature helps Power BI avoid performing unnecessary scheduled refreshes for reports that are no longer being used.

2. For which licensed user is dataflow creation possible?

Ans:

Dataflows can be created by users with a Power BI Pro or Power BI Premium Per User (PPU) license, depending on the workspace and the type of dataflow being used. A Power BI Free user generally cannot create dataflows in a regular shared workspace.

A user also needs the appropriate permissions in the workspace, such as the required editing or creation permissions. Dataflow capabilities can also vary depending on whether the workspace is backed by Premium/Fabric capacity.

Therefore, the ability to create a dataflow depends on both the Power BI license and the workspace permissions/capacity.
